

5 REASONS TO BUY

1 Reduces engagement, allowing faster advancement and less resistance.

5 Enables the dentist to work the walls of the canal in the larger diameter while preserving tooth structure and maintaining canal anatomy.

2 Patented flat along entire length increases instrument flexibility without compromising strength.

3 Can be used with current endo motor or any e-type air motor along with being tough and reusable, saving thousands of dollars.

4 Simple two-step process lets you quickly navigate to the apex.

Unlike other “reciprocating” systems, which eventually move in full rotation, Tango-Endo is truly reciprocating. It virtually eliminates binding and instrument separation. It has also helped doctors save thousands. Calibration rings provide quick and precise assistance in determining the working length. Tango-Endo eliminates the fear of fracture, helping you complete your endodontic cases in a simple and predictable process.
