

IRRITROL™

Two-In-One Endodontic Irrigation!

Irrigate, clean and rapidly disinfect the root canal in one step!

Irritrol is a single step disinfecting endodontic irrigation solution, used as a final rinse after sodium hypochlorite. Irritrol effectively disinfects, removes the smear layer, and is gentle on dentin. This single step solution efficiently removes the smear layer less aggressively than conventional irrigants, therefore causing less demineralization of the dentin. By incorporating this single step solution into your practice you will work faster, smarter, and more cost effectively -

Now you can save time and money over using EDTA and Chlorhexidine sequentially.

Features

Two-in-one endodontic Irrigant

Rapid, effective disinfection

Aids in successful root canal treatment

Gentle on dentin

Proprietary blend of irrigants and surfactants

Cleared by the FDA for endodontic use

Non-antibiotic

Green color

Benefits

Eliminates the need for separate step irrigation of EDTA and CHX irrigation

Independent testing showed that Irritrol had a disinfection rate of 99.99%*

Irrigate and rapidly disinfect the root canal removing germs that cause infection

Removes the smear layer less aggressively than conventional irrigants, therefore causing less demineralization of the dentin*

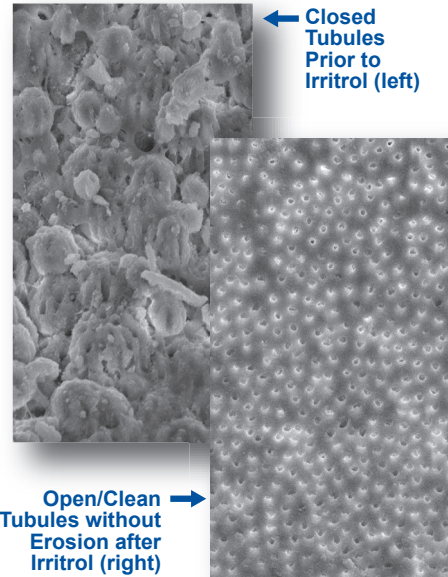

Provides reduced surface tension to easily flow into the dentinal tubules

Maintain confidence while removing the smear layer, irrigating, disinfecting, and cleansing the root canals

Helps prevent antibiotic overuse

Ensures easy identification for the dentist and assistant during the irrigation procedure

*Independently confirmed by Nelson Labs; Time kill study protocol #STP0158

Open/Clean Tubules without Erosion after Irritrol (right)

IRRITROL is available in a large economical 16 oz bottle!
